

CORDA User Manual

Functionalities and main tools of CORDA platform

CORDA is a single entry point node to the relevant national and regional geospatial reference data from EU39 countries (EEA 33 member countries and six cooperating countries) for Copernicus service providers. CORDA is managed by the European Environmental Agency.

Copernicus is an ambitious Earth observation programme aimed at providing accurate, timely and easily accessible information to improve the management of the environment, understand and mitigate the effects of climate change and ensure civil security.

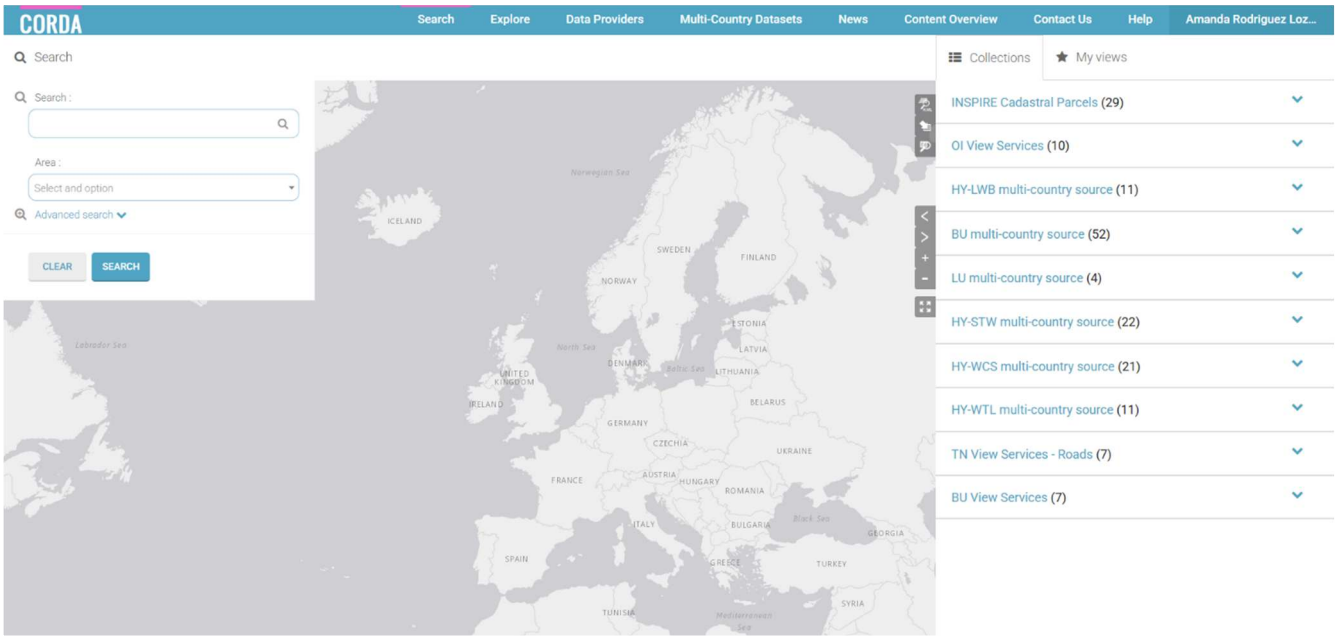

This initiative is headed by the European Commission (EC) in partnership with the European Space Agency (ESA).

At present CORDA only serves land monitoring and emergency management services. The scope of CORDA will be expanded to cover all the Copernicus services (marine monitoring, atmosphere monitoring, security and climate change).

1. CORDA Overview

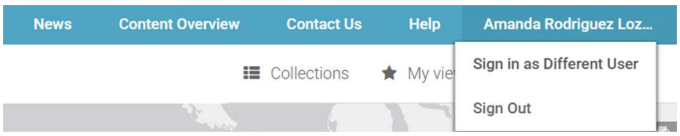

General view

CORDA platform is divided in seven sections. Each section and the actions that the user can performs will described in this document. These are the main section:

1. **Search**: Main page and search tool to access to datasets. The search could be performed using different criteria based in metadata and in the spatial coverage of the datasets. Collections and views are accessible from this page.
2. **Explore**: Dataset exploration page with the coverage of datasets by INSPIRE theme.
3. **Data Providers**: Data provider catalogue.
4. **Multi-Country Datasets**: Information about the creation of multi-country datasets.
5. **News**: News and publications.
6. **Content Overview:** Statistical information about data of dataset and data registered in CORDA.
7. **Contact Us**: Contact us for any questions or suggestions.
8. **Help:** Information about how to use CORDA.

Another important area is:

- **User area**: Allows to sign in or sign out.

User view

2. Search

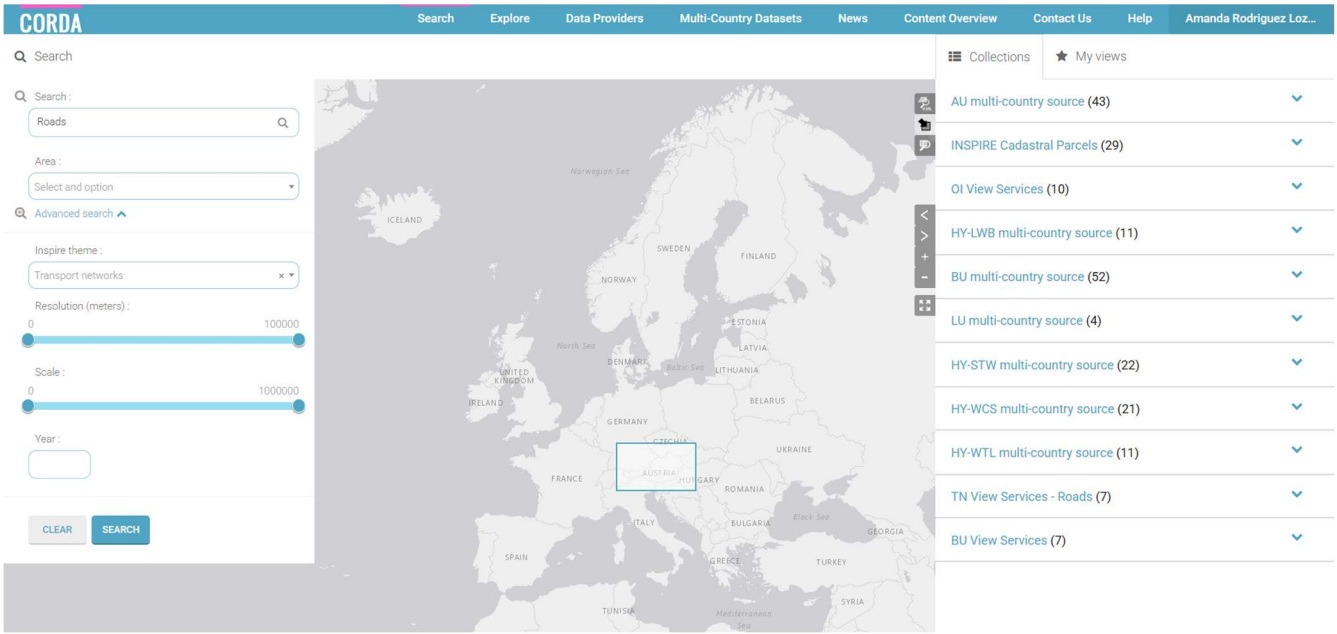

Search tab allows finding the stored data in CORDA by NUTS, dataset or custom area. Search is divided in three areas:

- **Search panel:** this panel have three main functions:
  - General search.
  - Spatial search.
  - Advance search.
- **Results:** after performing a search in the map or the advance search, the results will appear in the result page.
- **Map:** it provides a visual information and is also used to execute the spatial search.
- **Collections and My views tabs:** Collections are predefined list of resources created by CORDA Content Team. On the other hand, the user can create customised list of resources by using My views.

2.1. General search

General search is the simplest way to start searching is to use the CORDA search box.
Add descriptive words to the search box.

Try to choose words that are likely to appear on the dataset you're looking for. For example instead of using “wide ways”, use “roads”, because that word is more likely to be found in a spatial dataset.

CORDA Search page

The CORDA searching engine looks for those words in dataset title and keywords.

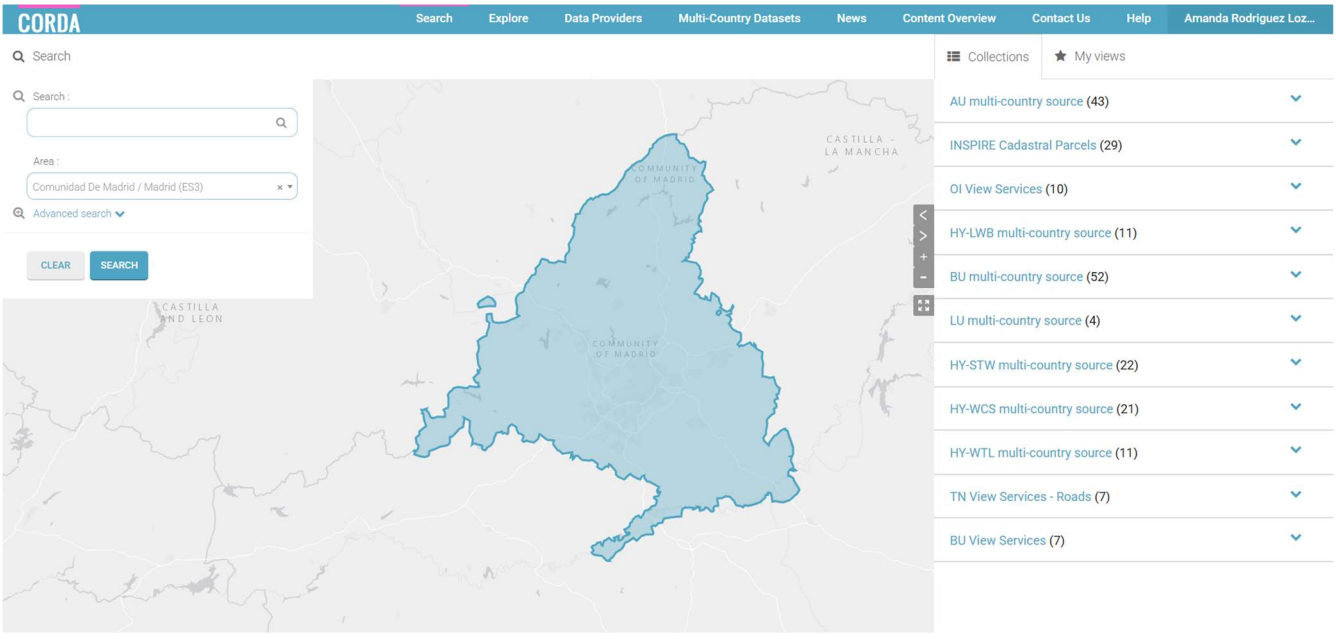

This engine uses the GEMET Thesaurus dictionary to find the related words in the dataset information. For example, if you search for roads the engine will find datasets with words like lines, footways, streets or trails.

Area box will allows you to filter the search by NUTS levels. You may choose the NUTS in a dropdown list. The box also admit the search option, you may write the name of an area, for example “Mad”, and the box will return a filtered list with the matches as result.

Result of matches

The NUTS region will be highlighted when an area is selected:

NUTS of Madrid Selected in the area box

As a result we will get the datasets inside selected area. Datasets are sorted using a simple algorithm and taking into account the coverage of the datasets. Click in search button to perform the search.

2.2. Spatial search

This feature provides more accurate **results in conjunction with the alphanumeric search.**

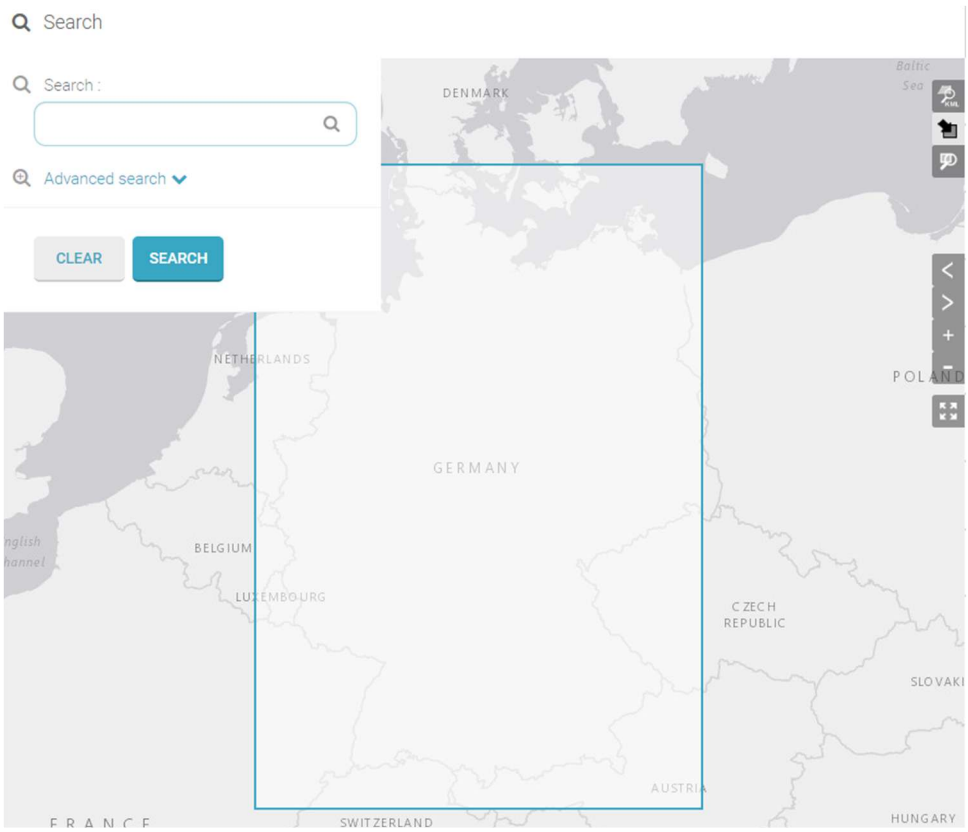

You may perform the spatial search in three ways:

- **Using a KML file (Keyhole Markup Language)**  : make click on the icon and the next window will appears at the left bottom of your screen.

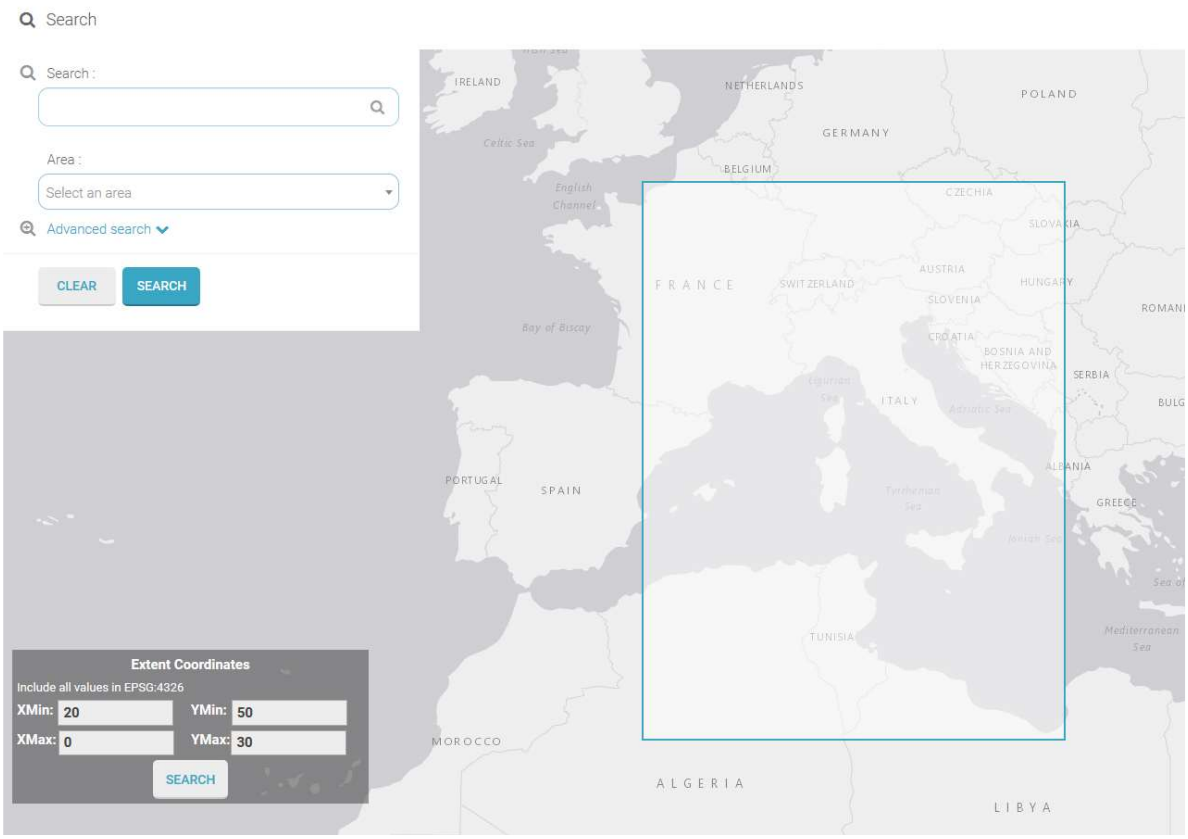

It allows the load of a KML file

- **Search by rectangle**  : draw a bounding box around a specific geographical area. The data is filtered by spatial coverage from data providers in a specific region.

Spatial search by rectangle

- **Search by bounding box**  : make click on the icon, after, write in the pop up the XMin, XMax, YMin and YMax coordinates. Click on search and the bounding box will be drawn.

Search by bounding box

All the datasets have a bounding box which defines the influence area of the Spatial data services that makes it up.

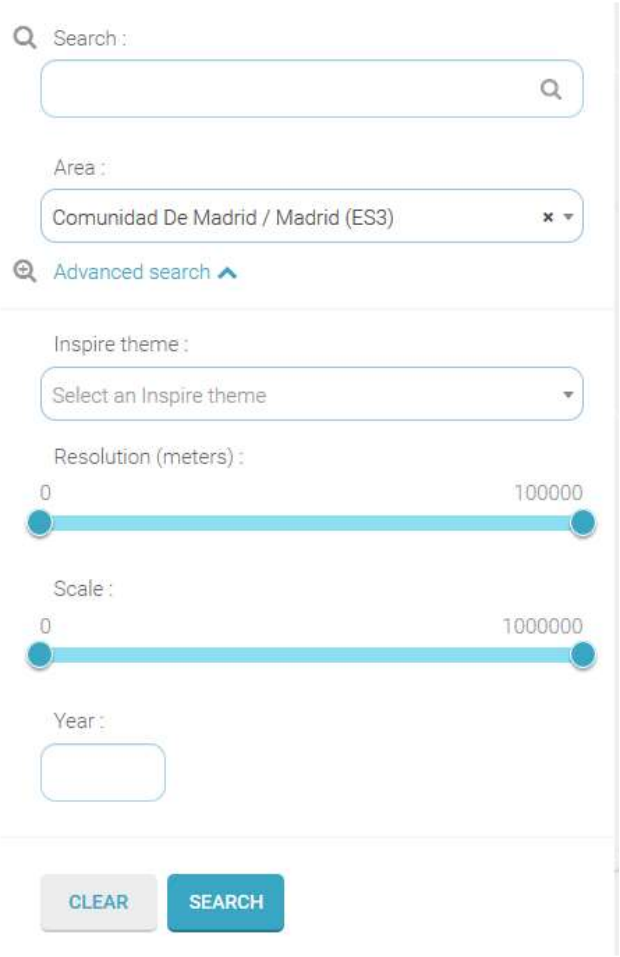

The spatial searching engine looks for the datasets that are contained or intersect with the drawn box.

You may access this feature using the vertical button bar in the top right-hand corner of the map. In the next section you will find the navigation and search tools in this button bar.

Finally, to execute any of these search, you only must make click in search button.

2.3. Advanced Search

You may use the advanced specific search to refine the spatial or general search and improve the results.

Search page

You may find datasets by Inspire theme, year, scale or resolution. Use the sidebars to define the range to be searched.

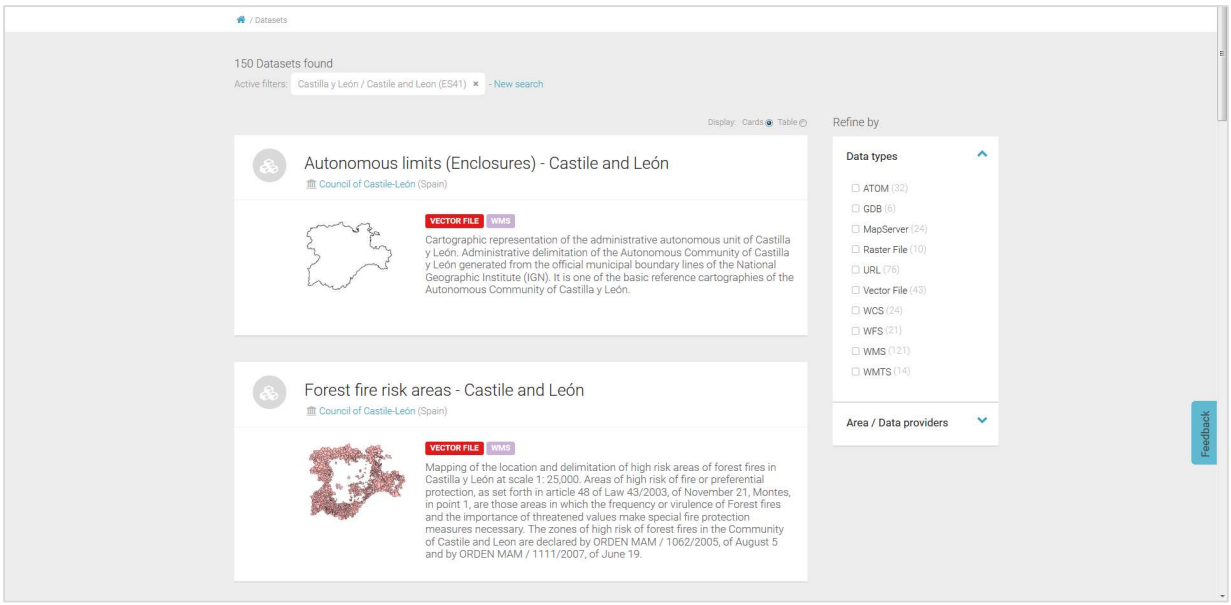

- Resolution: 1 – 100 meters
- Scale: 0 – 1000000

You may also combine the different tools to get more specific search results.

Always finish your search by clicking the search button to perform the combined search.

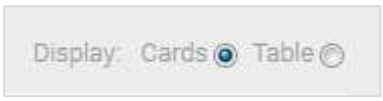

2.4. Result

After performing a search the list of datasets will be shown in the search tab.

Card view one of the view options

The result window has two visualisation options. The selection will be saved for future sessions.

- **Cards view:** provides information about; dataset title (1), provider (2), capabilities(3), data preview (4) and description (5)

Card of card view

- **Table view:** Compact view of the results without thumbnail and long description.

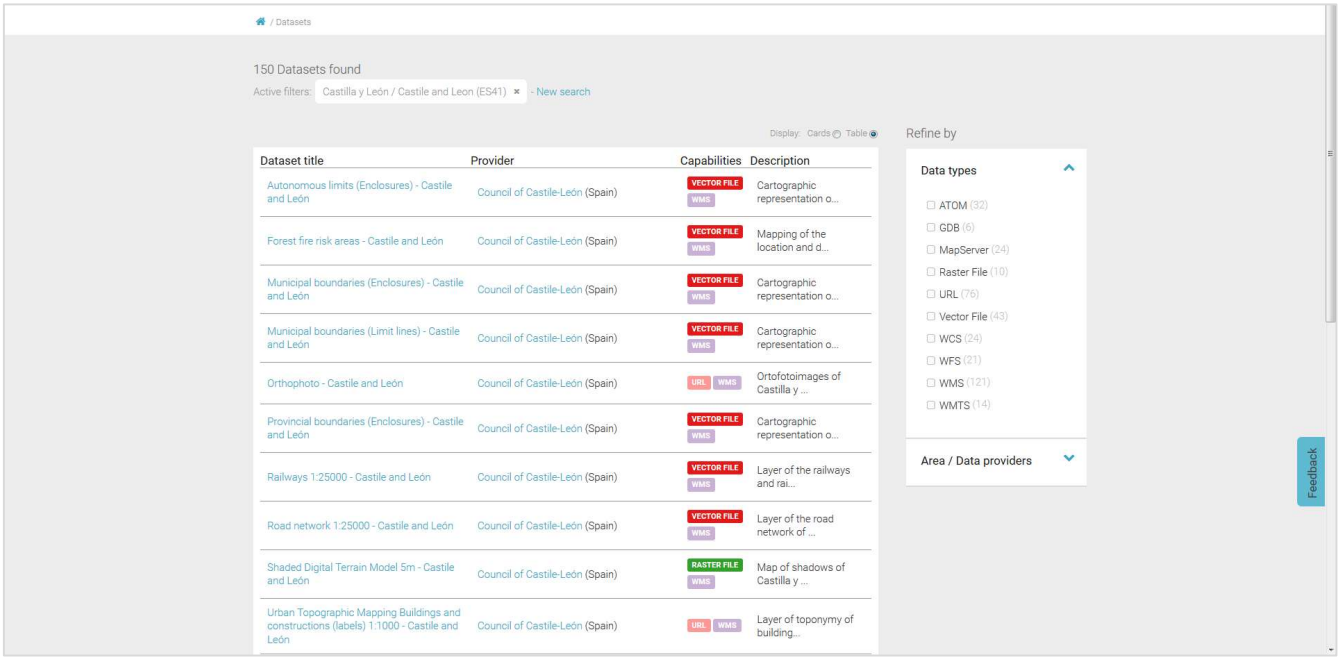

Table view

Row of table view

Make click on title to access the information of each dataset in table view. If the Card view is chosen click over view button to access to detailed information.

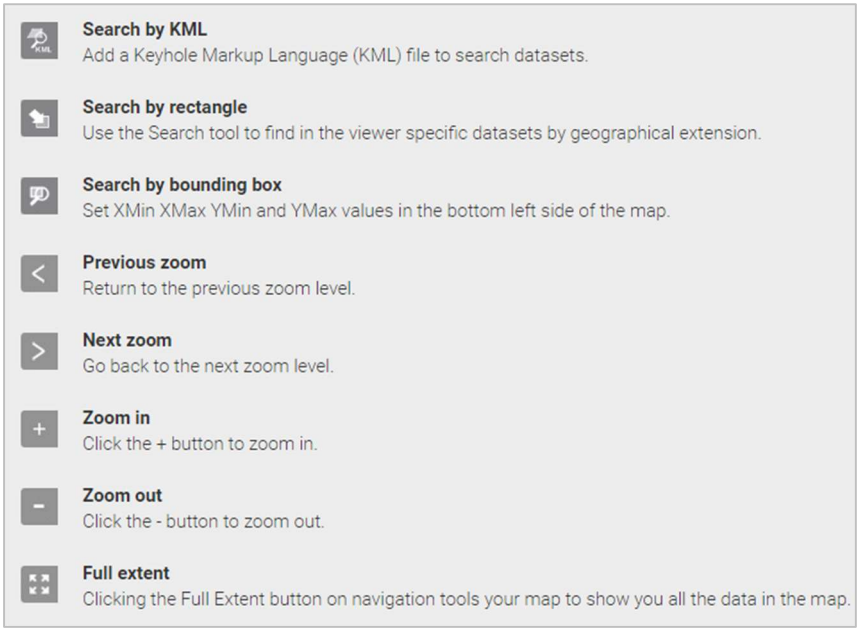

Selection view

2.5. Map

The basic functionality of any map viewer includes tools to navigate through the map and to interact with the layers of the services loaded in the viewer.

The navigation functions or common tools are included in the next picture:

Navigation tools.

You may also use your mouse and scroll wheel to zoom in and zoom out or press and hold the middle mouse button and move down or up to zoom in and zoom out.

2.6. Data collections and views

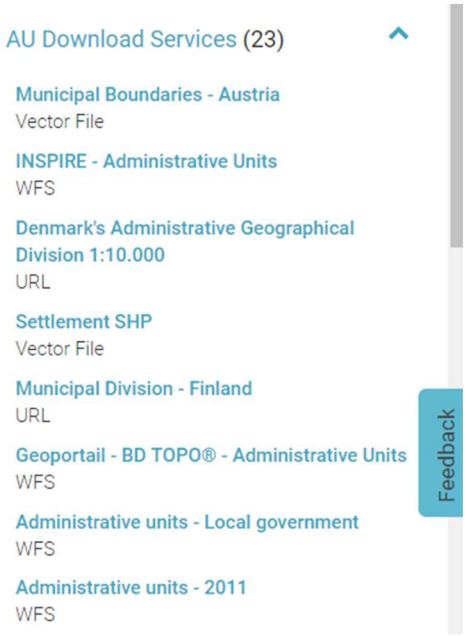

Data Collections and My views are accessible from the Search page.

Collections and views

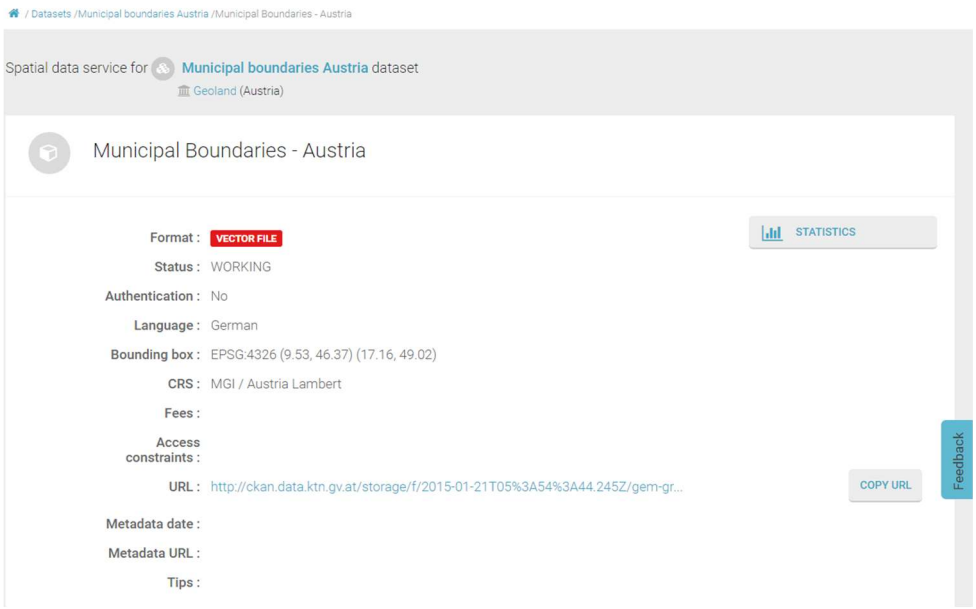

2.6.1. Collections

Click on the down arrow to the right of the data Collection title to see which spatial data services are available in that collection.

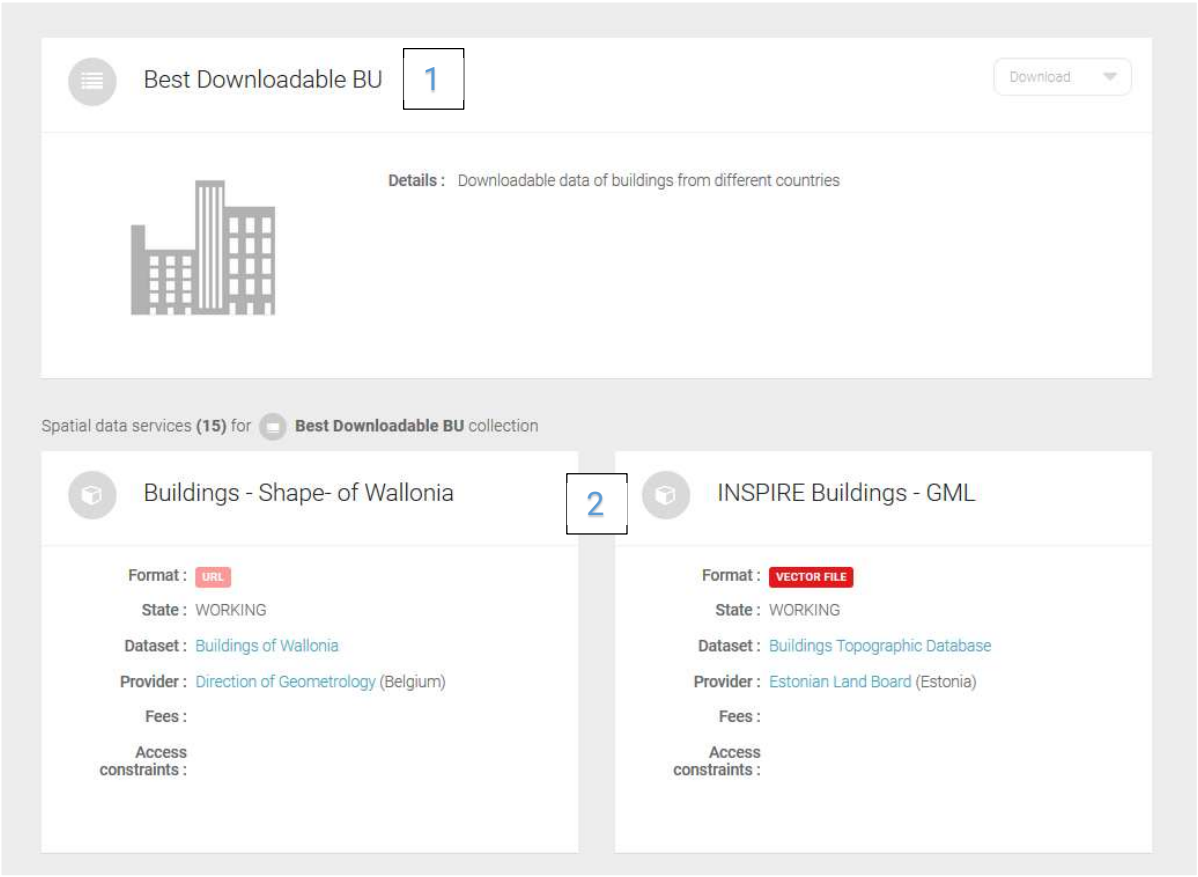

Collections widget

You may access to the data making click in the spatial data services title.

Spatial data service detail page

The collection information is accessible by clicking in the collection title:

Collection detail page

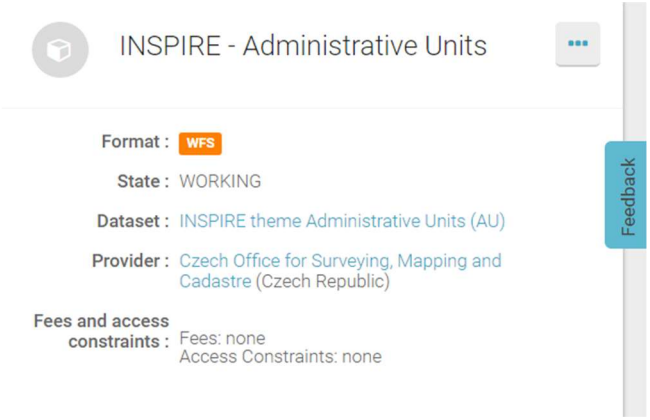

As you can see at the top image, this section is composed by the next areas:

1. **Collection Title:** if you place the cursor over the top right hand corner, a dropdown button appear.

You may choose the download format between CSV o QGIS project.

2. **List of cards:** this card provide a small data service description. You may access functions related to the spatial data service by placing the cursor over the top right hand corner, as is shown in the picture below.

Spatial data service card

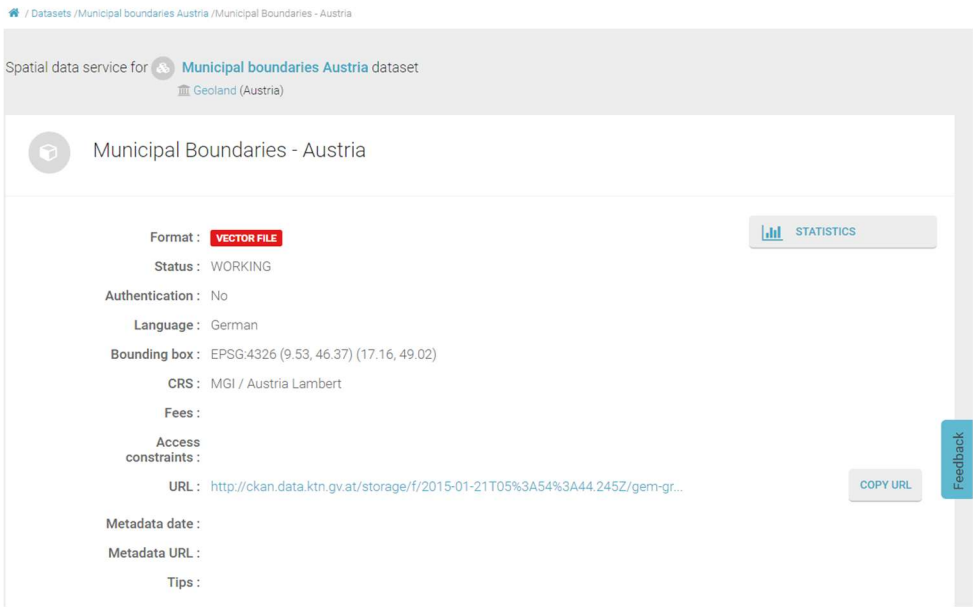

You may access functions related to the spatial data service by placing the cursor over the top right hand corner:

Spatial data service actions

This options allows users to view the data of the spatial data service, add it to your view, access statistics and to copy the spatial data service link.

- **View**: it opens the spatial data service detail page. This page is also opens if you make click in the spatial data services available in that collection.

Spatial data service detail page

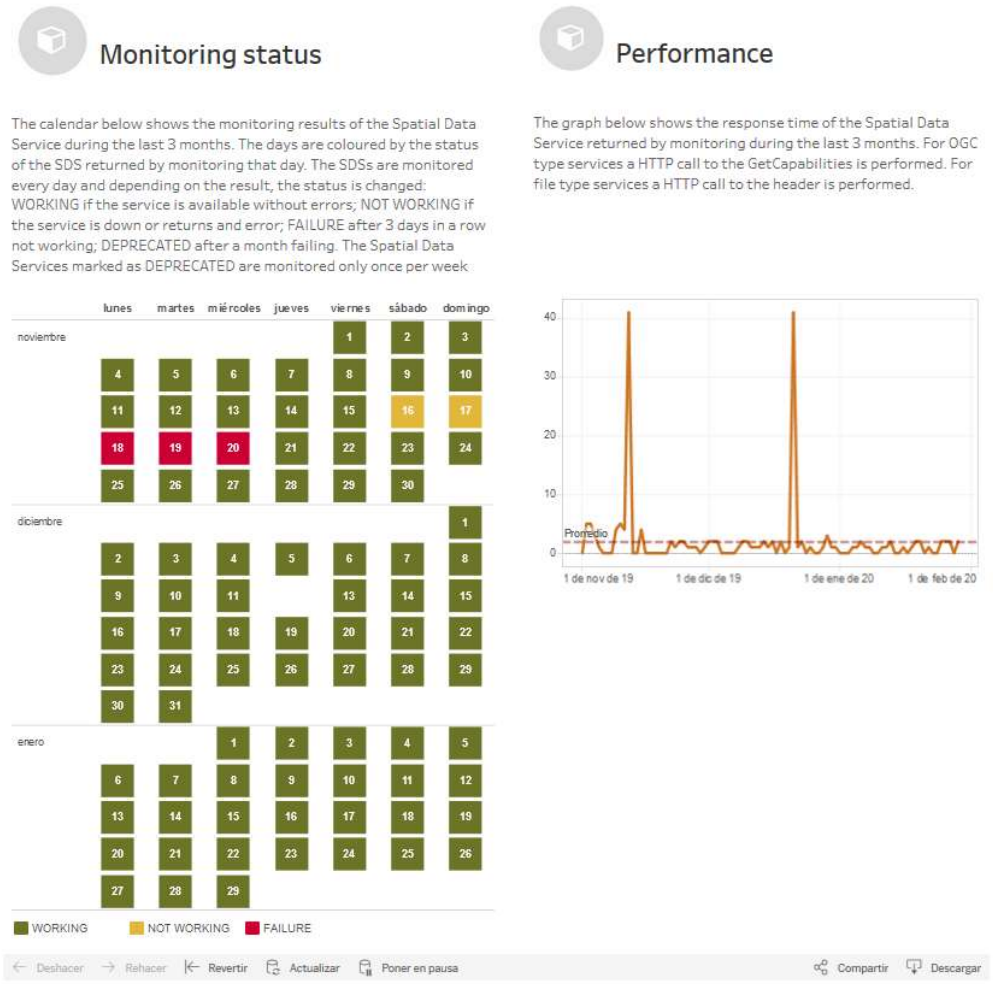

The detail page contains information about the service as; form, status, authentication, language, fees, access, constraints, URL, metadata date, metadata URL and tips.

- **Add to My views:** if you make click on it, a pop up appears. You may add the data service to your view groups. The View is ready to be used now and you may add several spatial data services.

View group add window

- **Statistic:** make click to open a new page with the data service statistic. You may download this statistic or share it.

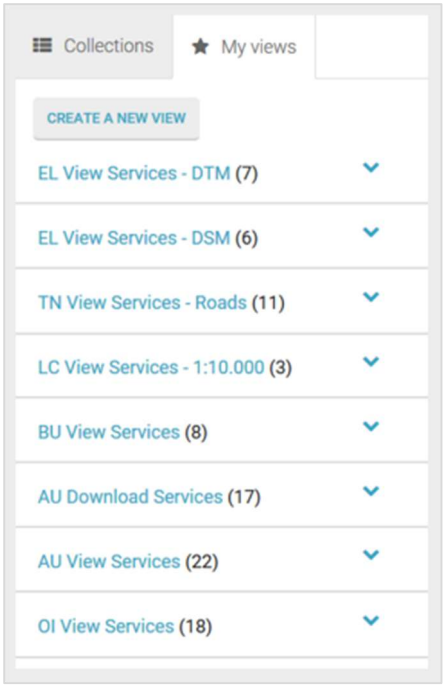

Statistic page

- **Copy Link:** make click on it to copy a download link.

2.6.2. My views

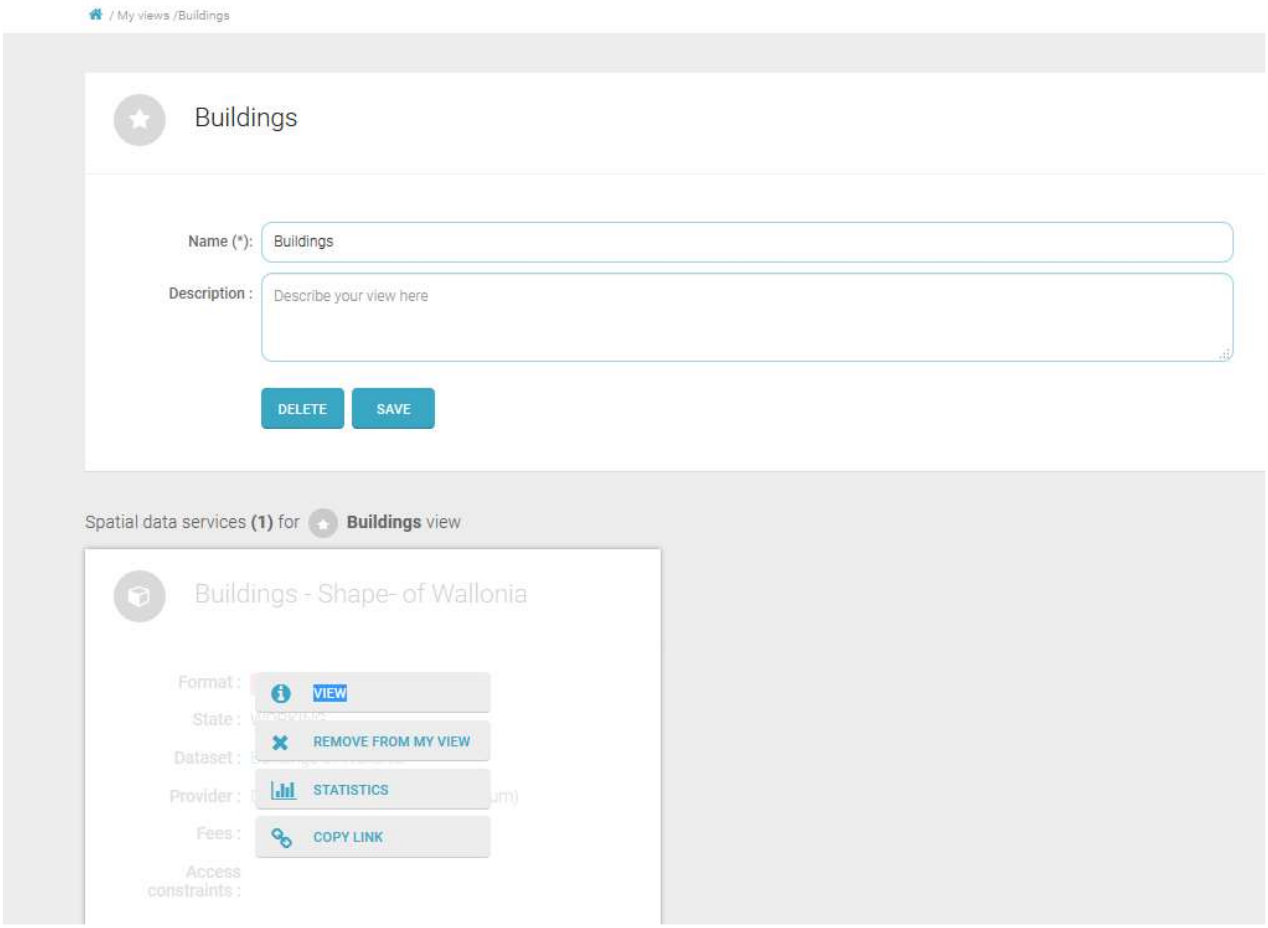

CORDA offers a “Views” functionality which allows users to save different lists of spatial data services, each one with a title and a brief description of its content. A View is a like a list of favorites and can save time in the searching process.

A View is created from the search page by selecting the Views tab (represented with a star) and clicking in the “new” link. An empty View can be created with a descriptive name and a longer description. The View name and description can be modified later in the View detail page.

Views widget

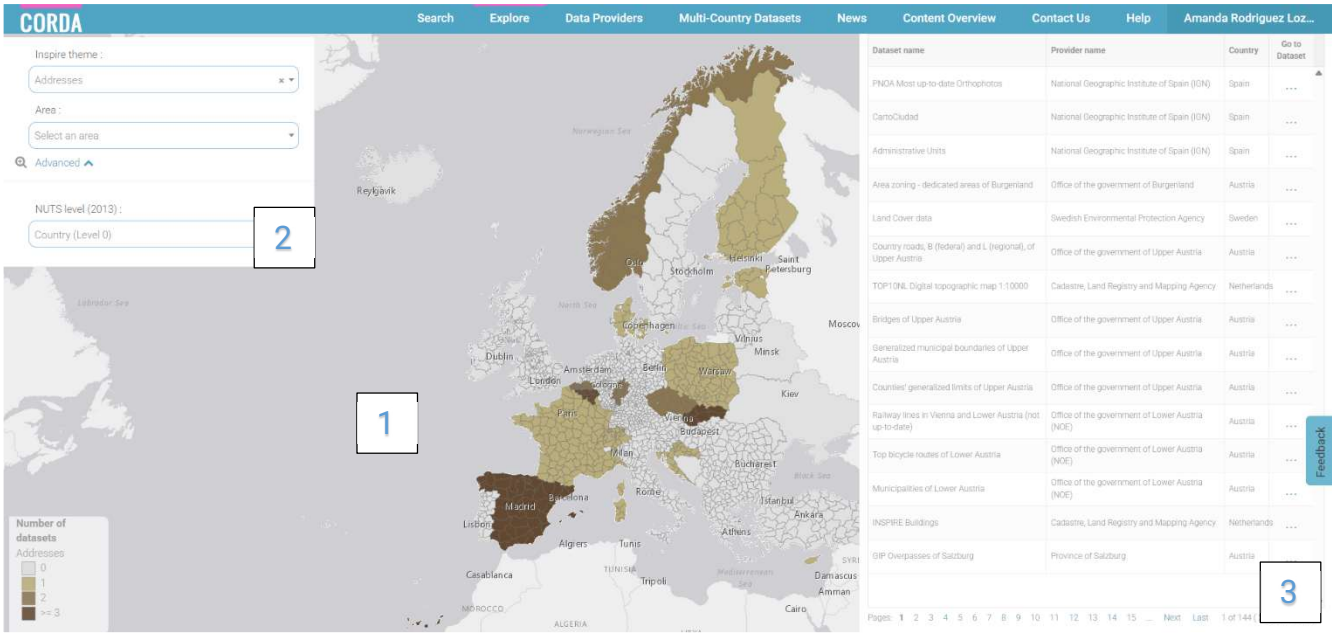

Spatial data services can be removed from a View in the detail page. You may also modify view name and description in the detail page. Also you may access to view detail page by clicking the view name in the Collections/Views widget. All the added Views are only shown to the user that has created them.

My views detail page

3. Explore

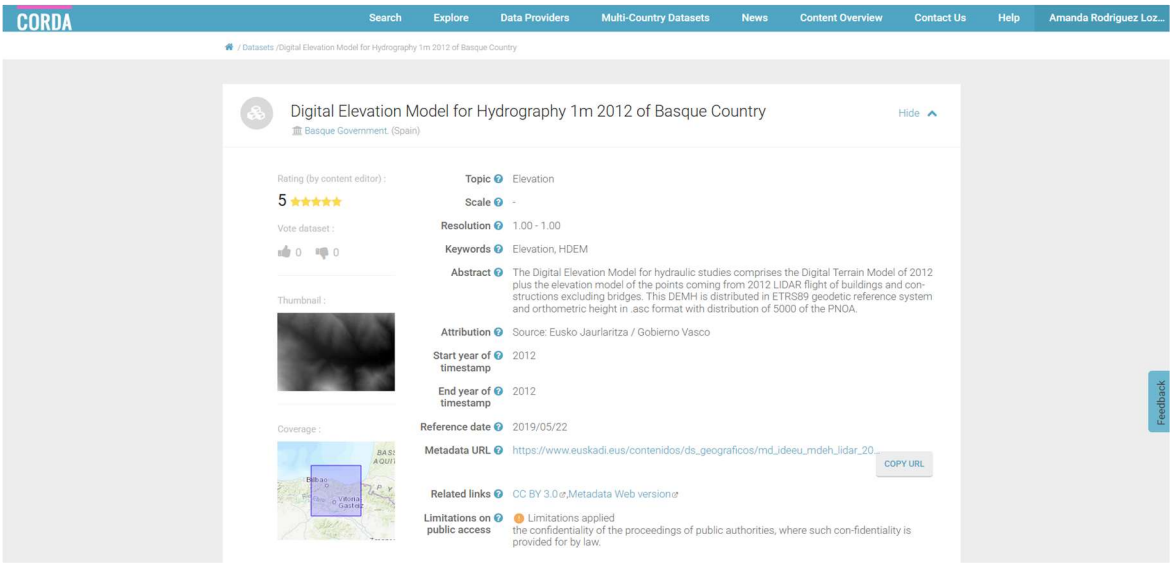

The exploration page provides thematic statistics at different NUTS levels. Choose NUTS level and area to obtain detailed information of the selected region.

Explore tab

The window is divided in three different areas:

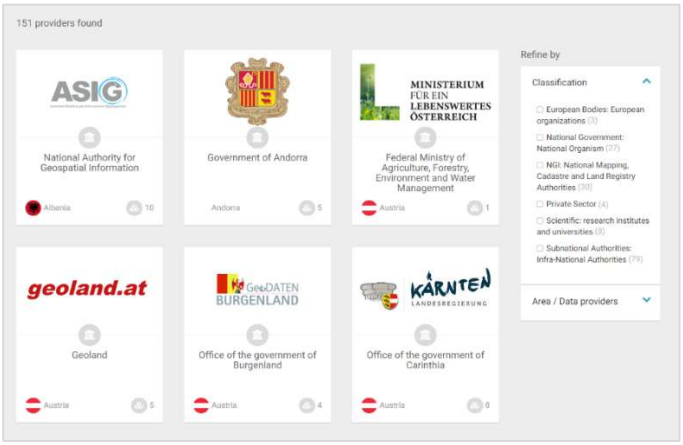

1. **Map:** use the map to select the area and view the datasets available for the selected area.
2. **Filters: f**ilter the datasets by Inspire theme and area.
3. **Dataset table:** list of available datasets for the selected NUTS region. Click on one row to display the dataset details page.

Dataset details page

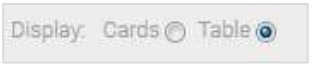

4. Data providers

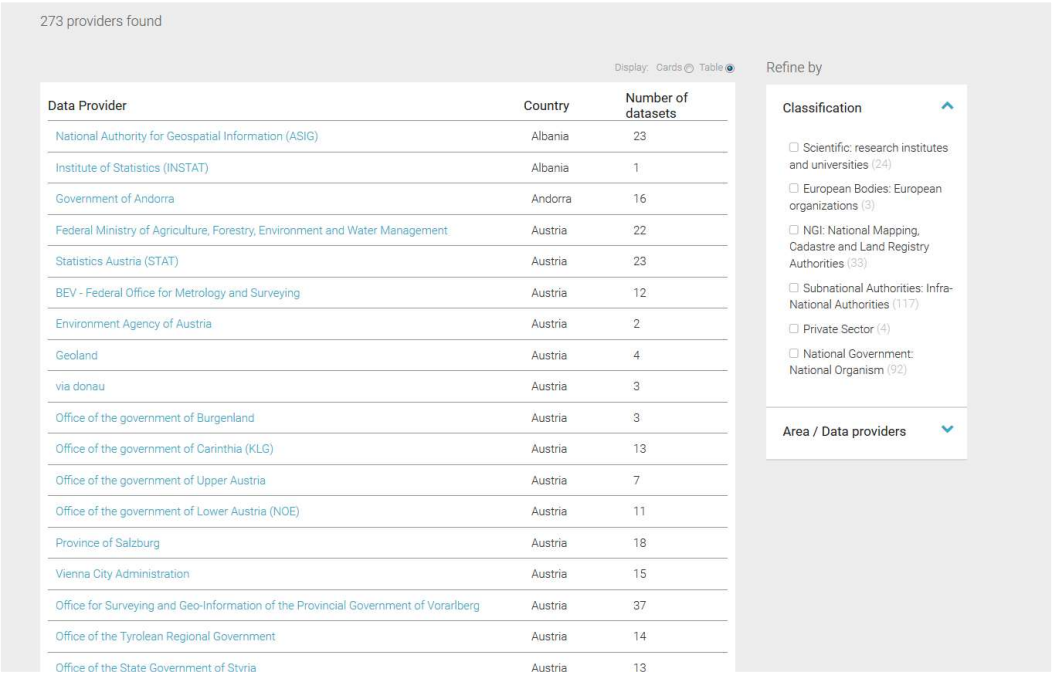

The data provider's catalogue lists all the data providers registered in the CORDA. It is accessible from the menu area and includes basic information.

Data provider's cards view

The information can be also provided using the table view.

Data Provider	Country	Number of datasets
National Authority for Geospatial Information (ASIG)	Albania	23
Institute of Statistics (INSTAT)	Albania	1
Government of Andorra	Andorra	16
Federal Ministry of Agriculture, Forestry, Environment and Water Management	Austria	22
Statistics Austria (STAT)	Austria	23
BEV - Federal Office for Metrology and Surveying	Austria	12
Environment Agency of Austria	Austria	2
Geoland	Austria	4
via donau	Austria	3
Office of the government of Burgenland	Austria	3
Office of the government of Carinthia (KLG)	Austria	13
Office of the government of Upper Austria	Austria	7
Office of the government of Lower Austria (NOE)	Austria	11
Province of Salzburg	Austria	18
Vienna City Administration	Austria	15
Office for Surveying and Geo-Information of the Provincial Government of Vorarlberg	Austria	37
Office of the Tyrolean Regional Government	Austria	14
Office of the State Government of Styria	Austria	13

Data provider's table view

Both views provide the name of data providers, country name and number of datasets. Click on view icon and get access to data provide details page.

Data provider's card

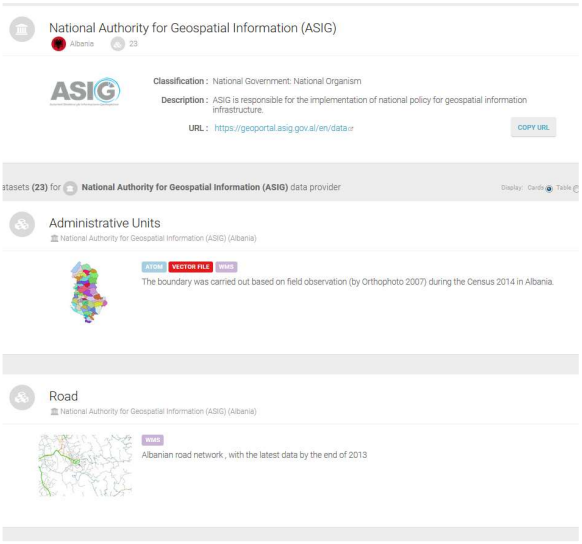

Make click on Data Provider name to get access to data provide details page in table view.

Data Provider	Country	Number of datasets
National Authority for Geospatial Information (ASIG)	Albania	23
Institute of Statistics (INSTAT)	Albania	1
Government of Andorra	Andorra	16

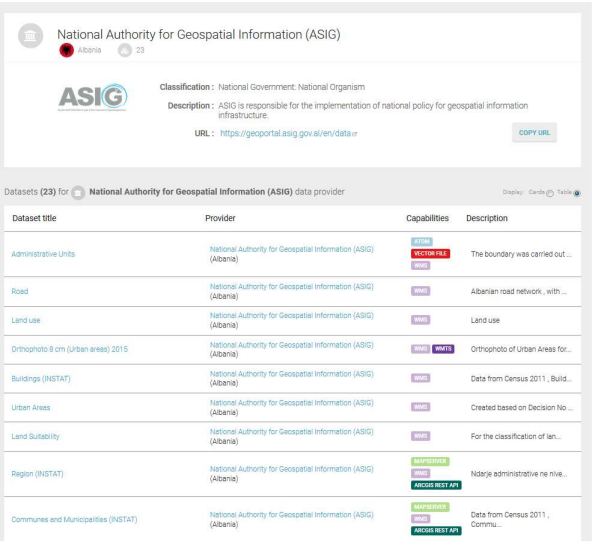

Data provider's table

4.1. Data provider details page

The data provide details page contains information about data providers and the list of datasets that are published in CORDA.

Data provider details page card view

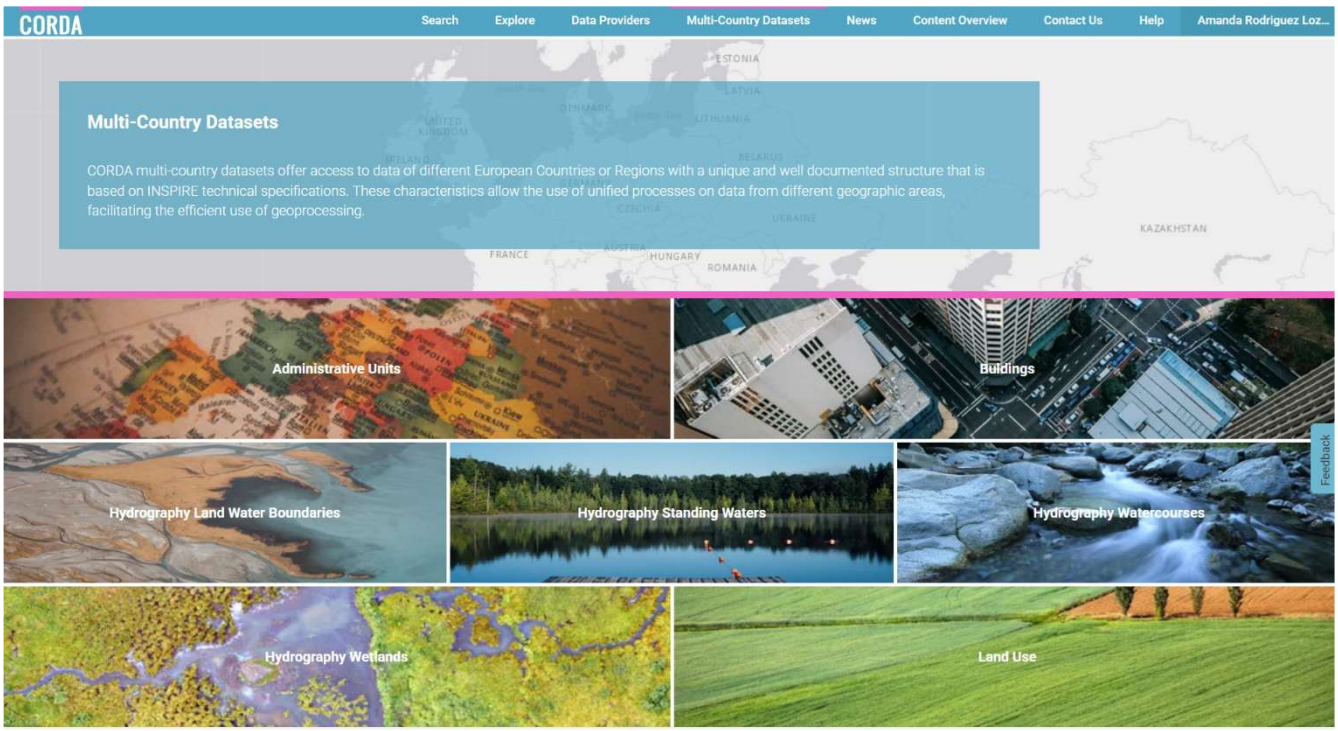

Data provider details page table view

The following information is provided:

- Card with the Data provider information; classification, description and data provider portal's URL.
- Dataset information; Dataset title, provider, capabilities and description.

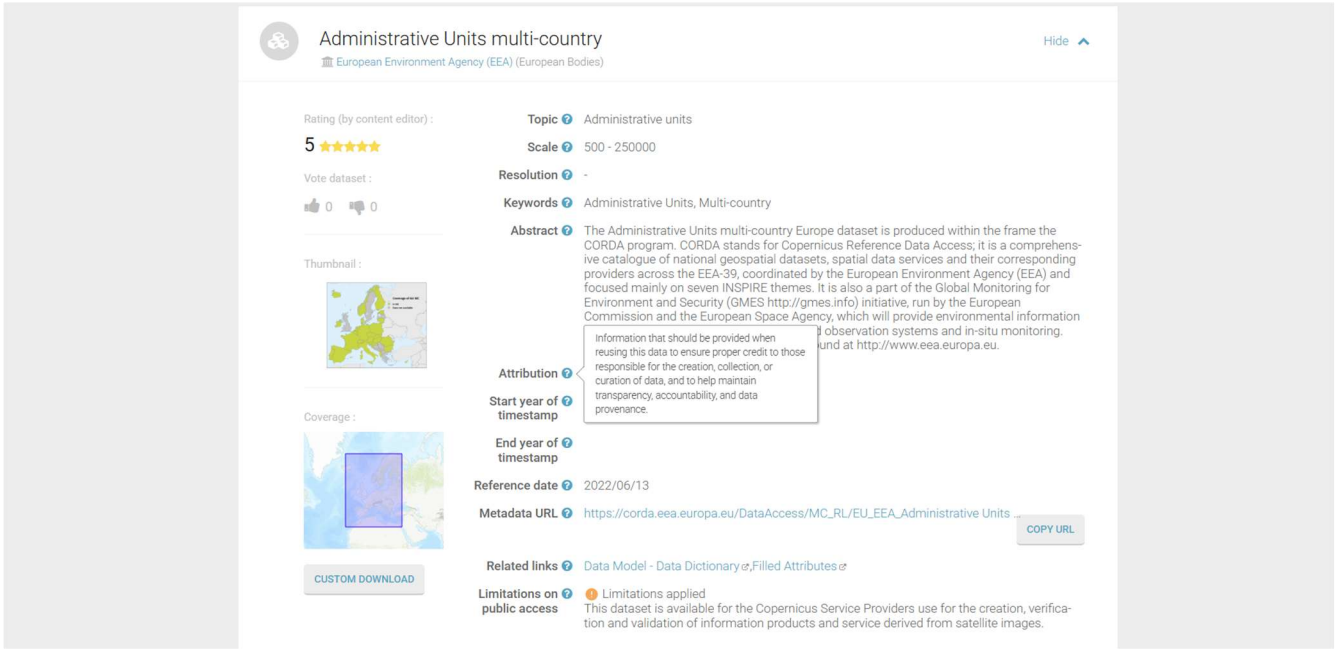

5. Multi-Country Datasets

This section provides the user with information about the creation process of the multi-country datasets.

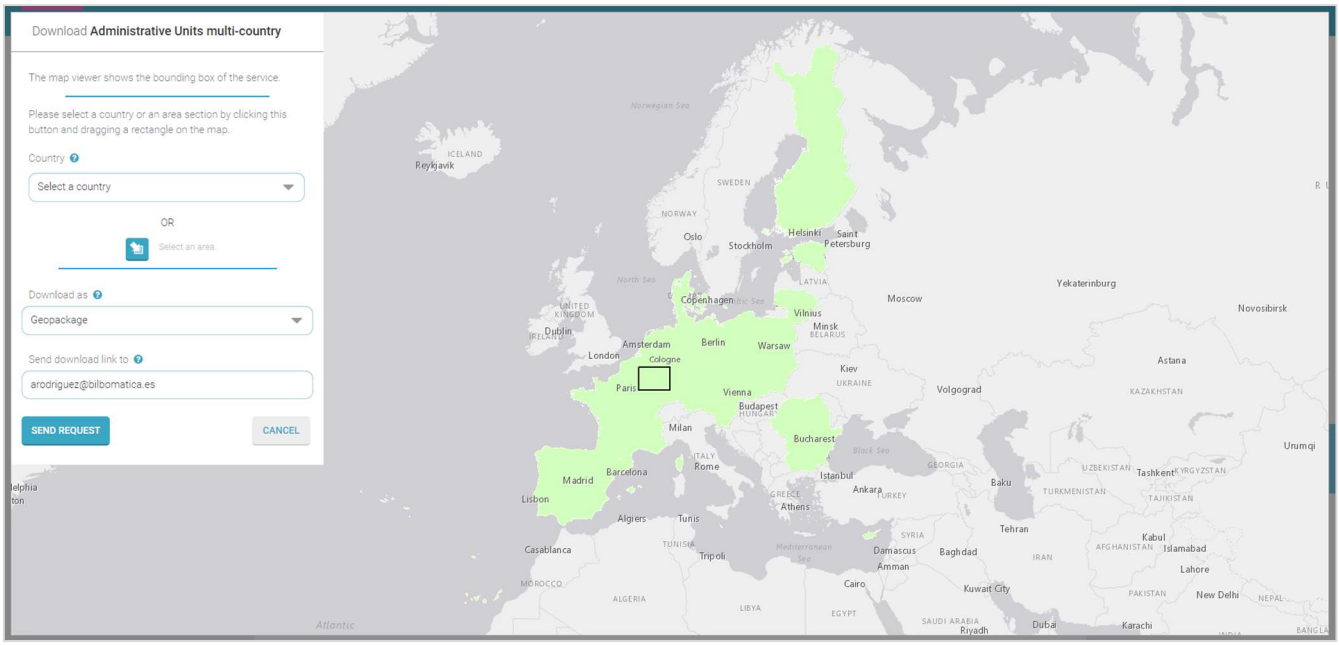

Multi-Country Datasets page

Select one of the seven multi-country datasets to access its detail page.
On each of the multi-country dataset detail pages there is information about it and a custom download option is also available.
Hover question icon next to the field name to show a description of each field.

Multi-country dataset detail

You can download by country or by selecting a bounding box on the map and in different formats.

Custom download

6. News

View the latest CORDA news by accessing to the news page. Last added dataset and spatial data services are available on the left part of the page.

Administrative Units, Hydrography and Buildings multi-country datasets are now available in CORDA

2019/11/20

New Multi-country Datasets

Multi-country datasets for administrative units, hydrography, and buildings have been grouped in a single resource with a flattened simplified data model based on INSPIRE to facilitate quick data retrieval by Copernicus Services.

- Administrative Units multi-country dataset

The first version of the Administrative Units multi-country dataset contains data from 20 countries (AT, BE, BG, CY, CZ, DE, DK, EE, ES, FI, FR, LT, LU, MT, NL, PL, PT, RO, SI, SK).

- Buildings multi-country dataset

The first version of the Buildings multi-country dataset contains data from 4 countries (EE, LU, CZ, LT).

- Hydrography multi-country dataset

The first version of the hydrography multi-country dataset including Hydrography Watercourses, Wetlands, Land Water Boundaries and Standing Waters contains data from 7 countries (DE, AT, LU, BE, DK, EE, LT).

Last added datasets

- Buildings of Toscana (2020/01/28)
- Regional Tecnical Map of Buildings (2020/01/24)
- ALKIS Building Footprints of Brandenburg (2020/01/23)
- INSPIRE Hydrography Physical Waters of Brussels (2020/01/14)
- INSPIRE Hydrography Physical Waters (2020/01/13)
- INSPIRE Administrative Units (2020/01/13)
- INSPIRE Elevation (2020/01/13)
- Digital Terrain Model 5m of Calabria (2019/12/10)
- INSPIRE Multitheme (2019/11/21)
- Topographic Map 1:5000 of Castile and León (2019/11/20)

Last added spatial data services

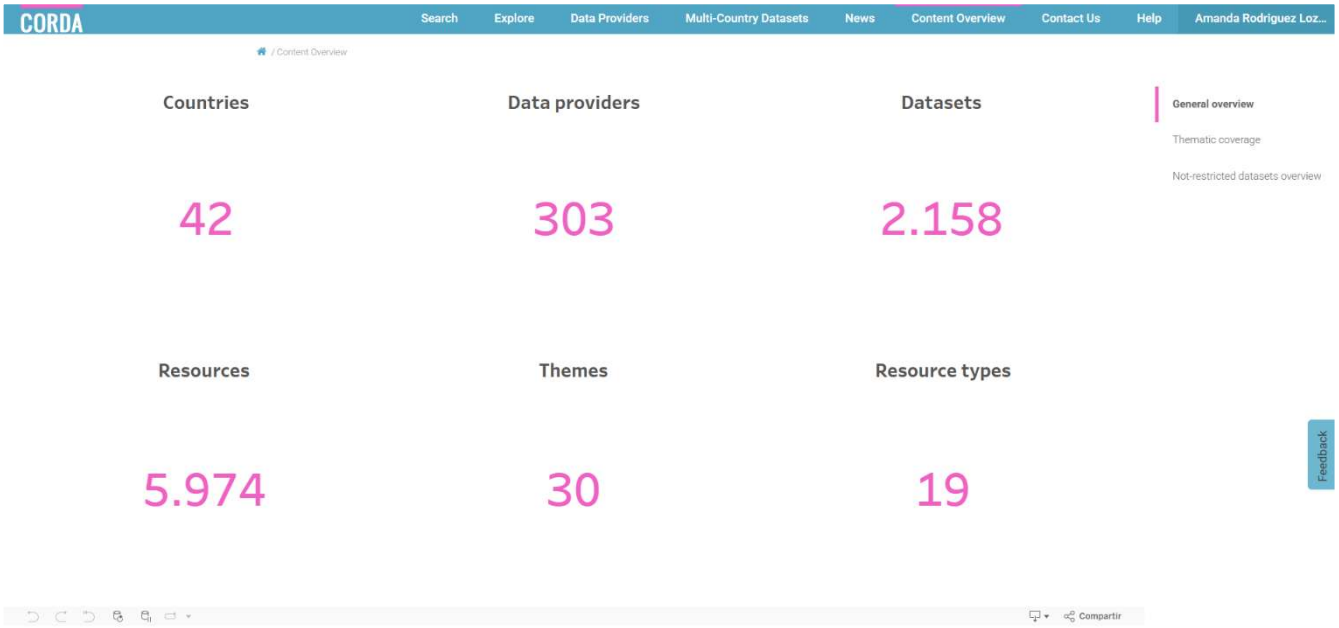

- Orthophotos of Thuringen (2020-01-29)
- Buildings of Toscana (2020-01-28)
- Main Layers of the Regional Tecnical Map of Valle de Aosta (2020-01-24)
- ALKIS Building Footprints - Shape - of Brandenburg (2020-01-23)
- INSPIRE Continental Hydrographic Network of Portugal (2020-01-22)
- PPIGE View Service (2020-01-22)
- Fundamental Base of Geographic Data of the Czech Republic (ZABAGED®) (2020-01-15)
- Administrative Boundaries of Brandenburg (2020-01-15)
- Historical Administrative Boundaries of Brandenburg (2020-01-15)
- Settlement Areas of Sorben and Wenden Brandenburg (2020-01-15)
